

INSTRUMENTATION RACKS

SemiProbe designs and builds a family of test instrumentation racks and shelves to hold a variety of test instrumentation – Power Supplies, SMU's, Parametric Analyzers, Vector Network Analyzers and more.

It is not uncommon for customers to order the probe system from one vendor and the test instrumentation from other vendors. Often what is overlooked is the location the test instrumentation is placed relative to the probe system and the impact it has on cable lengths, measurements, ergonomic user access and overall footprint.

The SemiProbe instrumentation racks are modular in design, are placed close to the probe system and have several configuration options. They are designed to handle heavy loads and multiple instruments. Shelves are easily adjustable, lockable when in position and field upgradeable. New shelves can be added at a later date and are customer installed.
